

# Third Progress Report

of

## Project - I

**Subject Code: 4IT31**

**Academic Year 2021-22**

**Group Number : G - 13**

**Name of Students : Kalp Gohil 18IT405**

**Man Desai 18IT404**

**Param Shah 18IT413**

**Jay Patel 17IT419**

**Topic : House Price Prediction**

**Guide Name : Prof. Prachi Shah**

**BACHELOR OF ENGINEERING**

*In*

**INFORMATION TECHNOLOGY**

**Birla Vishvakarma Mahavidyalaya  
Engineering College,  
Vallabh Vidhyanagar-388120**

## **Table of Content**

<b>Sr. No.</b>	<b>Topics</b>	<b>Page No.</b>
<b>1</b>	<b>Previous Work Done</b>	<b>3</b>
<b>2</b>	<b>Further Work Done on Modules</b>	<b>4</b>
<b>3</b>	<b>Remaining Work</b>	<b>12</b>
<b>4</b>	<b>Conclusion</b>	<b>13</b>

## 1 – Previous Work Done :

- Sign-Up / Login
- Data Cleaning & Pre-Processing
- UI Design

## 2 – Further Work Done on Modules :

### ❖ Prediction Page:

The screenshot shows a web browser window with the URL `127.0.0.1:8000/predict_price`. The page title is "House Price Prediction | Prediction". The navigation bar includes "Angel Real Estate", "Home", "Prediction", "logout", and "About Us". The main content area has the heading "Please fill up this form to Predict House Price." and contains the following form elements:

- Select Location**: A text input field with the value "Devarachikkanahalli".
- Total Square Feet**: A text input field with the placeholder "Enter Sqft.".
- Total Square Feet**: A text input field with the placeholder "Enter Number of bathrooms".
- Total Square Feet**: A text input field with the placeholder "Enter Number of Bedrooms".
- Predict**: A red button.

The footer of the page reads "© Copyright 2021 By Angel Real Estate." The Windows taskbar at the bottom shows the date and time as 07:58 on 21/10/2021, along with weather information (33°C Sunny).

### Code:

```
{% extends 'common.html' %}

{% load static %}

{% block title %} House Price Prediction | Prediction {% endblock %}

{% block content %}

<!-- Form Start -->

<div class="container my-4">

  <form action="predict_price_actual" method="GET">

    <div class="container">

      <h3>Please fill up this form to Predict House Price.</h3>

      <br>

      <label for="location"><b>Select Location</b></label>
```

## 4IT31: Project - I

---

```
<select      class="selectpicker    form-control"    id="location"
name="location" required>
```

```
{% for location in locations % }
```

```
<option value="{{ location }}">{{ location }}</option>
```

```
{% endfor % }
```

```
</select><br>
```

```
<label for="sqft"><b>Total Square Feet</b></label>
```

```
<input type="text" placeholder="Enter Sqft." id="sqft" name="sqft"
required>
```

```
<label for="bath"><b>Total Square Feet</b></label>
```

```
<input type="text" placeholder="Enter Number of bathrooms"
id="bath" name="bath" required>
```

```
<label for="bhk"><b>Total Square Feet</b></label>
```

```
<input type="text" placeholder="Enter Number of Bedrooms"
id="bhk" name="bhk" required>
```

```
<button      type="submit"      class="btn      btn-outline-
danger">Predict</button>
```

```
</div>
```

```
</form>
```

```
</div>
```

```
<!-- Form End -->
```

```
{% endblock % }
```

## ❖ Data Cleaning & Pre-Processing:

- **Description:** In this module, first of all, data set has been imported, then data has been cleaned and pre processed in order to predict accurate price.

### Code:

- **Outlier Removal using Business Logic.**
  - **Check size of each room.**

```
x = house[house['total_sqft'] < 1000]['total_sqft']
y = house[house['total_sqft'] < 1000]['size_BHK']
plt.scatter(x, y)
plt.ylabel('size_BHK')
plt.xlabel('total_sqft')
plt.show()
```

As a data scientist, when we have a conversation with business manager (who has expertise in real estate domain), he/she will tell that normally sq.ft. per bedroom is 300. If we have 400sq.ft apartment with 2 bhk, then that is like outlier for us. We will remove such outliers by keeping our minimum threshold for sq.ft per bhk to 300.

```
house = house[~((house['total_sqft'] / house['size_BHK']) < 300)]
```

- **Check no of bathrooms.**

```
plt.hist(house['bathroom'], width=0.8)
```

```
plt.xlabel('No of bathrooms')
```

```
plt.ylabel('Count')
```

```
Text(0, 0.5, 'Count')
```

After conversation with business manager (who has expertise in real estate domain), he/she will tell that normally number of bathrooms is equal or one more than number of rooms.

```
house = house[~(house['bathroom'] > house['size_BHK']+2)]
```

```
house = house[~(house['bathroom'] >= 9)]
```

### ❖ Train-Test Split using Sklearn:

```
X = house.drop(['price_lakhs'], axis=1)
Y = house['price_lakhs']
from sklearn.model_selection import train_test_split
X_train, X_test, Y_train, Y_test = train_test_split(X, Y, test_size=0.2)
print("X_train =", X_train.shape)
print("Y_train =", Y_train.shape)
print("X_test =", X_test.shape)
print("Y_test =", Y_test.shape)
```

```
X_train = (8072, 4)
Y_train = (8072,)
X_test = (2018, 4)
Y_test = (2018,)
```

### ❖ Handling Categorical Column:

```
from sklearn.preprocessing import OneHotEncoder
from sklearn.compose import make_column_transformer
from sklearn.pipeline import make_pipeline
from sklearn.linear_model import LinearRegression
from sklearn.metrics import mean_squared_error

ohe = OneHotEncoder()
ohe.fit(X[['location']])
ohe.categories_

column_trans =
make_column_transformer((OneHotEncoder(categories=ohe.categories_),
['location']), remainder='passthrough')
```

### ❖ Selecting Model:

- **Description:** We tried many regression model and results of them are as follow.

```
---- For Linear Regression ----  
Accuracy : 82.8091182793346 %  
RMSE : 34.908484140321875
```

```
---- For Decision Tree Regression ----  
Accuracy : 76.65343414199555 %  
RMSE : 40.68116843238034
```

```
---- For SVR ----  
Accuracy : 46.47308668476266 %  
RMSE : 61.59819898734227
```

```
---- For Lasso Regression ----  
Accuracy : 77.48152037294282 %  
RMSE : 39.95318874050546
```

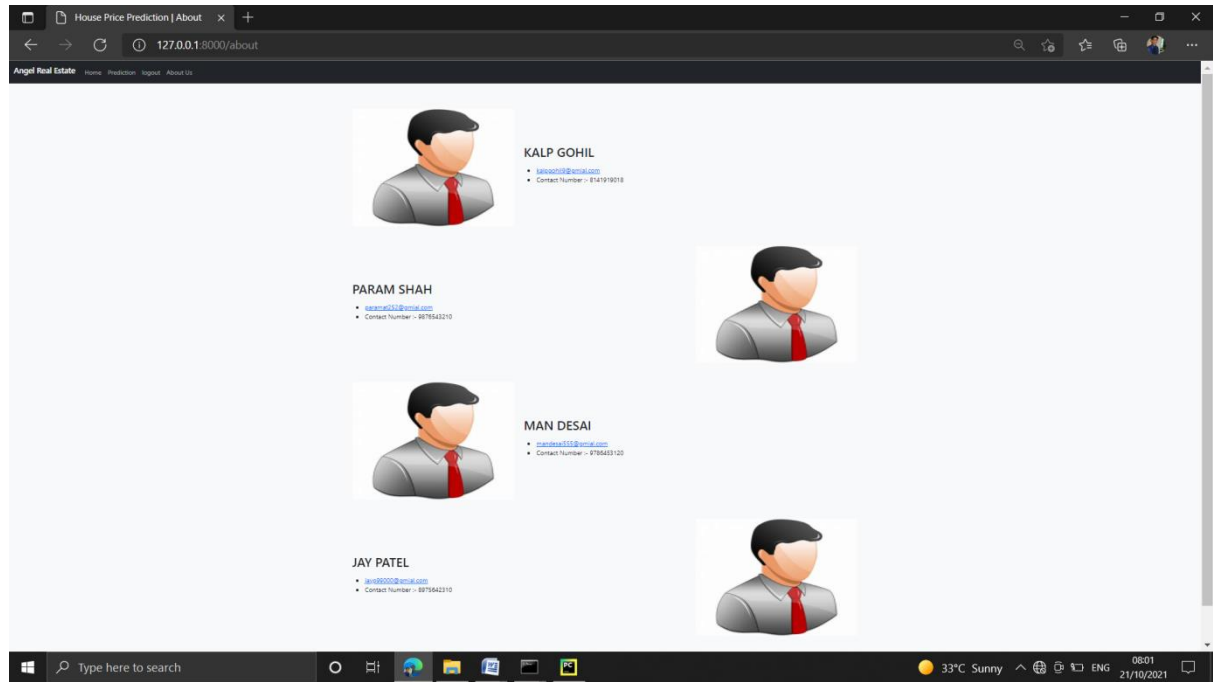

```
---- For Ridge Regression ----  
Accuracy : 76.68507224446014 %  
RMSE : 40.65359454156182
```

So, Here Linear Regression performs well.

### ❖ UI Design:

- **Description:** Here we had design about page.

### About Page

### 3 - Remaining work and Future Planning :

As Part of Second mid we have completed around 80% - 90% work and we are remaining with following work module wise:

#### **1) Model Training:**

- Here, as mentioned Linear Regression performs well. So we will train cleaned data using Linear Regression.

#### **2) UI Design:**

- As a front end, all the required pages has been designed. In backend, we need to attach our trained model with this website.
  - Also so UI part needs improvement, So we will be doing that also in this time.
- So, next we are planning to complete almost 100% of project before the second mid presentation. In that time we will complete our model training part along with its UI integration and as mentioned above.

## 4 - Conclusion:

As part of second mid presentation we have completed our SRS and other three progress report and also, we are done with around 80% - 90% work on actual system implementation. If some changes are required then we will take that into consideration and do changes in completed work.

\*\*\*\*\**The End*\*\*\*\*\*
